

*Retaining water, Increasing yields, Feeding families, Stabilizing economies*

Dear Abundance Farming Project Supporter,

Zeba could save Niger's cereal crops threatened by water scarcity next year. Recent millet tests showed the difference Zeba makes in crop production. **Reports from Niger, Africa, showed a 60% yield increase in millet grown with Zeba, and an amazing 110% yield increase in millet grown with Zeba and fertilizer together.** The test showed only 20% yield increase with fertilizer alone, so it's not fertilizer that makes the big difference, it's Zeba.

The photos and results are reported by ADEPA Executive Director Mounkaila Boureima, from Niger where most crop production was down due to droughts. Abundance Farming Project and ADEPA provided Zeba to these farmers.

**This farmer told me he has never seen something like it.**

**A small plot (1/4 hectare) with ZEBa producing more than a whole untreated hectare!**

**This man said he has never seen this kind of success in his field in years of farming.**

**For another farmer, draught wiped out everything else; it was only Zeba that produced any yield to sustain him.**

The stack on left is the ZEBBA treated millet while at right is not treated – from same size plots in the same field.

Field trial results from Niger showed: Fertilizer alone produced 20% yield increase over control plot, Zeba alone produced 60% yield increase / Zeba & Fertilizer together produced 110% yield increase  
Along with the water it provides, Zeba improves the uptake of soluble nutrients from the soil to the plant

On the left, a farmer carries the Zeba produced millet from field to the village.  
Wives of one farmer brought the newly harvested millet grain to sell for their daily financial needs.

Abundance Farming is committed to saving lives, increasing yields, and breaking the cycle of poverty.

**Please help us raise \$20,000 for Zeba in Niger...**
